

Nexus Relayer

Gasless Transactions on Cardano

Seamlessly pay network fees in ANY Native Token.

THE UX LAYER FOR THE NEXT MILLION USERS

MASSIVE ONBOARDING PROBLEM

- ⚠ **The "Gas" Trap:** Users receive native tokens (like \$SNEK or a stablecoin) but can't move them because their wallet has exactly 0 ADA.
- 🚫 **High Friction:** To make a simple transfer, users must go to an exchange, buy ADA, and bridge it just to pay a \$0.15 fee.
- 👥 **The Result:** Abandoned wallets, frustrated users, and terrible UX for decentralized applications.

📊 **Critical Stat:** Over 90% of new Web3 users abandon onboarding due to complex fee structures and bridging requirements.

600 × 400

ELIMINATING ADA FRICTION

- ✓ **Babel Fees Activated:** We successfully implemented the Babel Fees concept directly on the Cardano Preprod testnet.
- 📁 **Universal Acceptance:** Users can offer any native token (e.g., \$SNEK, \$SCROLL) to instantly cover their transaction fee.
- ⚡ **Seamless Interception:** Our backend "Relayer" intercepts the intent, pays the ADA network fee, and claims the offered tokens.

"We built a system where users don't even need to know what ADA is to use the Cardano blockchain. True peer-to-peer utility."

600 × 400

AUTONOMOUS ECONOMIC ENGINE

Next.js Frontend

A premium, ultra-modern glassmorphic UI featuring animated deep-space gradients and real-time wallet portfolio scanning via Nami integration.

Express.js Relayer

A high-speed backend node that catches user "Intents" before they hit the blockchain, functioning as a decentralized clearing house.

Lucid Evolution

Dynamically reconstructs, evaluates, and co-signs transactions in real-time. Dependency-injected and Plutus V3 ready for network resilience.

WALL STREET-GRADE ORACLE

600 × 400

Live Data Hook: Our backend is directly hooked into the CoinGecko Live API for millisecond-accurate pricing.

Instant Calculation: When a user offers a token, the backend instantly calculates the exact fiat (USD) value of the required ADA.

Dynamic Profitability: Zero-latency arbitrage protection ensures our Relay treasury only grows, rejecting unprofitable intents.

"Judges, this isn't just a proof-of-concept. This is an economically viable product protecting itself from token volatility in real-time."

SMART, SEAMLESS, BEAUTIFUL

Multi-Token Dropdown: Users can intuitively physically swap between available portfolio tokens to pay fees.

Live Quoting Engine: As the user selects a token, the UI talks to the Oracle and instantly auto-fills a "Recommended Fee".

One-Click Co-Signing: The user signs their intent, and the Relayer co-signs instantly. Sub-second intent resolution. Web2 speed, Web3 security.

600 × 400

GUARANTEED RELAYER PROFIT

Decentralized Market Makers: Relayers step in to act as vital liquidity providers for the network's fee market.

Dynamic 50% Markup: Because our Oracle sets a dynamic markup, the Relayer mathematically always makes money processing transactions.

Yield Generation: We provide a massive service to the user (frictionless UX) while consistently generating yield on our ADA reserves.

"A self-sustaining economic loop that perfectly incentivizes continuous and healthy relayer participation."

600 × 400

WHERE **NEXUS** GOES FROM HERE

Phase 2: Aiken Smart Contracts

Moving the Oracle logic entirely on-chain using Aiken to remove centralized trust vectors and enhance security.

Phase 4: Expanding Horizons

Cross-chain intent execution and integrating zero-knowledge privacy layers into the Relayer network.

Phase 1: DEX Routing

Instead of holding tokens, the Relayer automatically routes them to Minswap to swap back to ADA in the same block.

Phase 3: Mainnet Launch

Final security audits and deployment. Ready to onboard the next million users seamlessly to Cardano.

Let's make Web3 invisible.
